

Pokemon Classification Problem

Intermediate presentation

Team members: Hardo Niit, Hans-Erik Atonen, Kelli Kukk, Annika Altoja

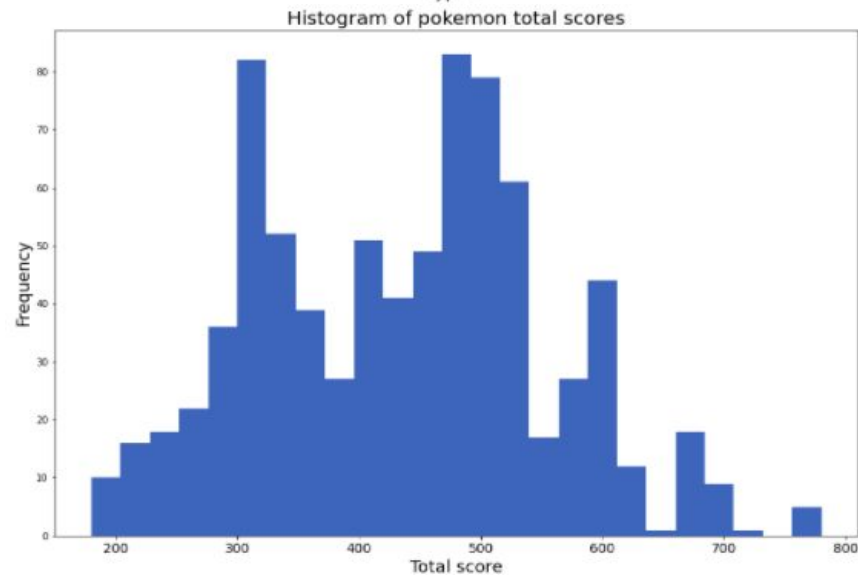

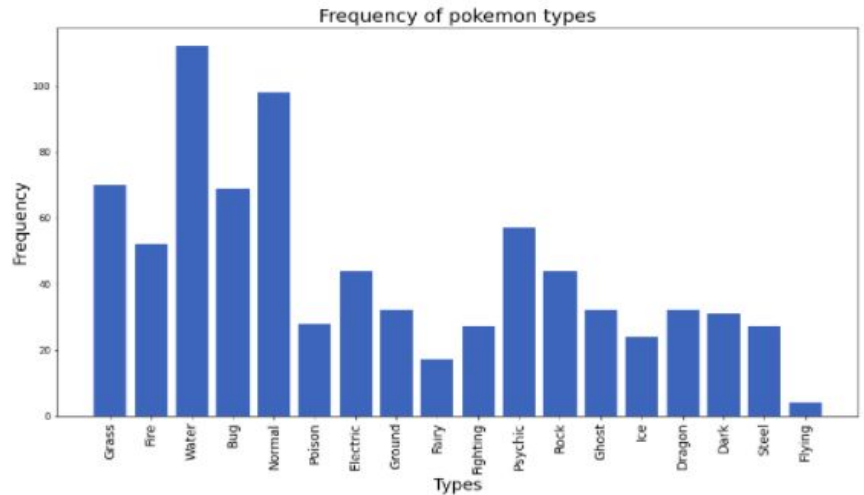

Data

- Data comes from Kaggle
- Pokemon dataset
- 800 observation (721 unique Pokemons) 12 describing variables

What we have done?

- Mainly statistical analysis
- Bar plots, histograms etc.

Problems we are facing?

- At the moment no problems have occurred...
- ...But main problem is lack of time (other courses, homeworks, projects etc.)
- Maybe too few data (we have not tried to model it yet)

Future steps!

- We want to train different models for classification
- Compare the results, which models can predict better

Thank you!
